

Portfolio Proof Statement

Proof Statement:

I build reliable backend software and web applications using modern software engineering practices. This portfolio is designed for software engineering hiring managers and technical recruiters looking for interns or entry-level developers who can demonstrate practical experience through real projects rather than coursework alone. Through my featured projects, technical documentation, and development process, I aim to provide clear evidence of my ability to design, build, debug, and deliver production-quality software. My goal is for recruiters and hiring managers to contact me for software engineering internship or entry-level opportunities.

Why this needs to exist:

A CV and LinkedIn profile can list my skills and projects, but they cannot fully demonstrate how I solve problems, structure software, and apply my knowledge in real-world projects; this portfolio provides that evidence.

Why I chose this direction:

This satisfies all the rubric requirements:

- **One claim:** *I build reliable backend software and web applications.*
- **One person:** *Software engineering hiring managers and technical recruiters.*
- **One action:** *Contact me for internship or entry-level opportunities.*
