

AZAN SHAH

.NET / Full-Stack Developer & AI/ML Engineer · Week 3 Visual Identity & Image Curation

AS

Portfolio positioning

A technical portfolio centered on building real software: production full-stack applications, REST APIs, databases, and practical ML pipelines. The visual system should feel clean, technical, and credible while keeping the projects as the strongest visual evidence.

1. Identity Kit

Typography	Space Grotesk — headings / Inter — body	Mood	Minimal · technical · confident · evidence-first
Near-black	#111111	Near-white	#F8F8F6
Primary accent	#2563EB	Optional neutral	#555555

Two-line style note: Space Grotesk and Inter keep the interface modern and readable without making the portfolio feel decorative. Near-black, near-white, and one blue accent create a calm technical identity where real project evidence stays louder than the design.

2. Image Map — Based on the Current Portfolio

Portfolio area	Preferred image	Decision
Hero / landing section	Minimal supporting visual or subtle AI texture	AI is acceptable only as connective tissue; do not generate fake project screens.
About Me	Existing real photograph	REAL — the portfolio already uses a personal image; keep the person authentic.
Indoor Sports Booking Management System	Real UI screenshots + dashboard	REAL — strongest proof because this is described as live in production.
Hotel Management System	Real application screenshots	REAL — show the Razor UI and booking/admin functionality actually built.
Student Academic Outcome Prediction	Real Streamlit dashboard / model output	REAL — the dashboard and pipeline are evidence of the ML project.
Peer-to-Peer File Distribution	Real Tkinter/log screenshots or architecture	REAL — show actual implementation rather than a generated networking graphic.
MyBook Social Networking Platform	Real application screenshots	REAL — show the actual social platform and its features.
Decorative icons / transitions	Simple consistent icons	Keep restrained; decoration should support navigation, not become the subject.

3. Curation Decisions

Rejected AI image	A generic AI-generated coding/developer illustration would look polished but would not prove anything about Azan's actual projects. It adds visual noise without evidence, so a real project screenshot is the better choice.
Real capture over AI	For the Indoor Sports Booking Management System, use real screenshots because the portfolio states it is live in production and describes concrete booking, checkout, Stripe, authentication, and admin-dashboard behavior. A generated mockup would weaken that proof.
Real photo over AI	Keep a real personal photograph in the About section. The portfolio is about a real developer, so authenticity matters more than a perfectly stylized AI portrait.

Curation rule

Real work proves. AI supports. The current portfolio already has a strong evidence-led structure: a production booking platform, an ML dashboard/pipeline, and several completed software projects. The visual identity should make those projects easier to understand, not replace them with generic AI imagery.
