

FL-01: Workflow Audit

1. Workflow Audit:

#	Recurring Task	Classification	One-line Rationale
1	Research APIs and third-party integrations for internship/client projects	Collaborate with AI	AI accelerates research and explains concepts, but I verify everything using official documentation.
2	Read and understand technical documentation (APIs, frameworks, SDKs)	Delegate to AI with Review	AI summarizes lengthy documentation, but I review the original before implementation.
3	Debug ASP.NET Core, Entity Framework Core, and SQL Server issues	Collaborate with AI	AI suggests possible fixes, while I identify the root cause and validate the solution through testing.
4	Develop backend APIs and business logic for semester and personal projects	Collaborate with AI	AI helps with implementation ideas and boilerplate code, but I make architecture and coding decisions.
5	Build frontend components in React and integrate them with APIs	Collaborate with AI	AI assists with component structure and debugging, while I ensure the UI meets project requirements.
6	Write SQL queries, LINQ queries, and optimize database operations	Delegate to AI with Review	AI generates query drafts quickly, but I verify correctness and performance before use.
7	Train, evaluate, and improve machine learning models for academic projects	Collaborate with AI	AI helps analyze results and suggests improvements, but I interpret metrics and choose the final model.
8	Prepare technical documentation, README files, and project reports	Delegate to AI with Review	AI creates a structured first draft, and I review it for technical accuracy and completeness.
9	Prepare for interviews by studying .NET, SQL, APIs, and Machine Learning concepts	Delegate to AI with Review	AI explains concepts and generates practice questions, but I verify my understanding independently.
10	Write professional emails, internship applications, and LinkedIn messages	Delegate to AI with Review	AI improves clarity and professionalism, while I personalize every message before sending.
11	Plan weekly internship goals, coursework, and project milestones	Collaborate with AI	AI helps prioritize tasks, but I make the final decisions based on deadlines and workload.
12	Attend meetings, gather requirements, and communicate with supervisors	Just Me	Understanding requirements, asking questions, and building trust require my direct participation.
13	Decide project architecture, technology choices, and implementation strategy	Just Me	These decisions involve technical judgment, trade-offs, and accountability that I must own.
14	Generate repetitive boilerplate code (DTOs, models, CRUD scaffolding, documentation templates)	Fully Automate	These repetitive tasks follow predictable patterns and only require a final quality review.

2. Claude Project Custom Instructions:

Project Name

ML Internship - FlyRank

Custom Instructions

About Me:

I am Azan Shah, a Software Engineering student at FAST-NUCES and an ML Intern at FlyRank. I primarily work with ASP.NET Core, C#, SQL Server, React, Python, and Machine Learning. I frequently research APIs, debug applications, and build software projects.

My Goals:

- Become highly productive using AI.
- Learn practical Machine Learning workflows.
- Improve software engineering skills.
- Produce accurate, professional technical documentation.
- Strengthen research and problem-solving abilities.

How I Want Claude to Help:

- Explain technical concepts clearly with practical examples.
- Prioritize official documentation over blogs.
- Ask clarifying questions when requirements are unclear.
- Highlight assumptions and potential risks.
- Never fabricate technical facts.
- When generating code, explain why each important part exists.
- Keep answers concise unless I ask for detailed explanations.

Tone:

Professional, direct, structured, and educational.

3.

4. Three Target Tasks:

1. API & Technical Research

Why I selected it: This is one of my most common internship tasks.

Success Definition

- Research completed within **45 minutes**.
- Information gathered from at least **3 reliable sources**, including official documentation whenever possible.
- Final summary includes integration approach, limitations, costs (if applicable), and implementation considerations.
- No significant factual errors after verification.

Debugging Software Applications (.NET & SQL)

Why I selected it: Debugging is a frequent part of both my internship and academic projects.

Success Definition

- Root cause identified within **30 minutes** for typical issues.
- At least **two possible solutions** evaluated before selecting one.
- Final solution tested successfully without introducing regressions.
- Issue and solution documented for future reference.

3. Technical Documentation & Learning

Why I selected it: I regularly study new technologies and prepare documentation for projects.

Success Definition

- Produce concise notes within **20 minutes**.
- Include key concepts, examples, and best practices.
- Organize content into clear sections for future reference.
- Be able to explain the topic without relying on the original documentation.
